

# Product Feature AERATION

## Why Aerate?

- Increases and stimulates shoot growth
- Improved wetting of dry soils
- Accelerates drying of wet soils
- Increases infiltration
- Creates a full plush lawn with healthy growth

**Core-Free Aeration:** Save time and avoid the mess with the Ventrac Aera-Vator's core-free aeration.

## A Healthy Lawn is an Aerated Lawn

The simple act of aerating can prevent thatch, improve drainage, increase oxygen and grow a thick healthy lawn.

One major reason to aerate is to relieve soil compaction. Grass growing in compacted or wet or slow draining soil is often invaded by weeds and develops thick thatch. A heavily thatched lawn is deprived of oxygen and won't allow for good root growth, resulting in grass die off. Drainage will be poor and not allow nutrients to reach the root system.

## FEATURED PRODUCTS

**Aera-Vator EA600**

**Aerator EB480**

“People say, ‘make my yard look like a million bucks...’

To do that, you've got to **aerate**, fertilize, and overseed it. We start in March. We put the **aera-vator** on, spike the holes in, put the seed out and fertilize. About the first of April we start cutting grass.”

# Why Use Ventrac

## Aerator attachments?

**Aerator EB480**

Ventrac has more aerating choices to address your lawn care needs. Lower your equipment costs by utilizing versatile attachments to get your work done.

**Open spoon & slitter tines (EB480)** create a hole without bringing a core to the surface, saving the extra step of cleanup. Delivers penetration of the soil with minimal disruption to the surface, yet allows for benefits to the health of the turf.

**Core tines (EB480)** will extract cores to allow for more drainage opportunity. This method allows fertilizers, water and nutrients to be incorporated quickly into the soil.

**Slitter Tine**

**Open Spoon Tine**

**Core Tine**

**Vibrating Tines (EA600)** fractures the surface to aerate by loosening the soil beneath the sod without destroying the surface. This method also creates an ideal soil bed for seeding and is best for hard, dry soil. The Aera-Vator leaves the turf ready to use immediately after treatment with no down time. You also have the ability to aerate and over-seed at the same time with the optional Seed-Box.

**Aera-Vator EA600**

*Optional Seed-box on the Aera-Vator allows for over-seeding and aerating simultaneously.*
